This text is designed to provide instructors with a convenient single text resource for bridging between general and algebraic topology courses. Two separate, distinct sections (one on general, point set topology, the other on algebraic topology) are each suitable for a one-semester course and are based around the same set of basic, core topics.

Munkres also does the Smirnov Metrization Theorem which relies more on paracompactness. But Kelley does Moore-Smith convergence and nets-a way of doing topology with sequences, and only gives a reference for Smirnov. The Munkres text gave a brief introduction to homotopy and the fundamental group-Kelley none.

This is probably the best textbook on point-set topology (or general topology) ever written. Munkres is an excellent expositor. The book does demand a certain maturity; the definitions of a topology, a compact set, and a continuous function are quite unintuitive, and Munkres gives only a limited amount of motivation for them.

Topology (2nd ed.) | James R. Munkres 3. Let x_0 and x_1 be points of the path-connected space X . Show that $\pi_1(X; x_0)$ is abelian if for every pair γ, η of paths from x_0 to x_1 , we have $\gamma \circ \eta = \eta \circ \gamma$. (i) Suppose $\pi_1(X; x_0)$ is abelian, and let γ, η be paths from x_0 to x_1 . Since γ and η are both homomorphisms from $\pi_1(X; x_0)$ to $\pi_1(X; x_1)$, we have $\gamma \circ \eta = \eta \circ \gamma$.

How useful is topology in theoretical physics? By topology, I mean the contents of Munkres book, Hausdorff spaces, homeomorphisms, etc. It seems to me like topology is totally a mathematical construct since the idea of an "open set" in an abstract space seems to have no "physical" meaning outside of Euclidean spaces.
