Standard Test Method for Unconsolidated-Undrained Triaxial Compression Test on Cohesive Soils¹
This standard is issued under the fixed designation D 2850; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision.

Standard Test Method for Unconsolidated-Undrained Triaxial ...

In an 'unconsolidated undrained' test the loads are applied quickly, and the sample is not allowed to consolidate during the test. The sample is compressed at a constant rate (strain-controlled). Our Triaxial Test System provides automated triaxial compression tests on cylindrical undisturbed and remolded soil samples.

A triaxial shear test is a common method to measure the mechanical properties of many

deformable solids, especially soil (e.g., sand, clay) and rock, and other granular materials or powders. There are several variations on the test. In a triaxial shear test, stress is applied to a sample of the material being tested in a way which results in stresses along one axis being different from the ...

STRESS STATE DURING A TRIAXIAL TEST The stresses applied to a soil or rock specimen when running a triaxial compression test are displayed in Figure 3. The confining stress σ_c is applied by pressurising the cell fluid surrounding the specimen – it is equal to the radial stress σ_r , or minor principal stress σ_3 .

An extension of the QU test is the unconsolidated undrained test (UU); this is similar to the QU test but is run at a slower rate in order to measure pore water pressure. By comparison, effective stresses when measured in a triaxial cell are more complex in their nature, as numerous parameters can be measured.
