Solving two-step linear equations using distributive property:  $a(x + b) = c$  ;  $a\left( {x + b} \right) = c$   $a(x + b) = c$ . Distributive property is an algebra property that we use all the time! When you see equations in the form of  $a(x+b)$ , you can transform them into  $ax+ab$  by multiplying the terms inside a set of parentheses. In this section, we ...

Using the Distributive Property when Solving Equations. ... Continue solving the one or two-step equation. Let's look at a couple of examples to clarify those steps for you. This first example is a pretty basic equation that involves the distributive property. Take note of how I distribute first before applying the rules for solving equations.

**Using the Distributive Property When Solving Equations**

Using Distributive Property Solving Multi-Step Equations. Solve equations involving the distributive property of multiplication. These equations require the student to distribute a multiplied value across terms within parentheses before combining like terms. It is usually not easy to do it in any other way.
