PHP (recursive acronym for PHP: Hypertext Preprocessor) is a widely-used open source general-purpose scripting language that is especially suited for web development and can be embedded into HTML. Nice, but what does that mean? An example: What distinguishes PHP from something like client-side ...

PHP: What is PHP? - Manual
Since PHP 5.3, it is possible to leave out the middle part of the ternary operator. Expression expr1 ?: expr3 returns expr1 if expr1 evaluates to TRUE , and expr3 otherwise. Note : Please note that the ternary operator is an expression, and that it doesn't evaluate to a variable, but to the result of an expression.

Documentation. The PEAR documentation is a centralized place where developers can add the documentation for their package. Currently the documentation is available in the following languages:

Documentation - pear.php.net
Since strtr (like PHP's other string functions) treats strings as a sequence of bytes, and since UTF-8 and other multibyte encodings use - by definition - more than one byte for at least some characters, the three-string form is likely to have problems.

PHP: strtr - Manual
The name "PHP" is a recursive acronym for "PHP: Hypertext Preprocessor" and was initially created by Rasmus Lerdorf in 1994. As of today, the current version of PHP is version 5, with version 6 in the making. As mentioned, PHP is mostly used on websites, which is what this tutorial will focus on.
